

6-DAY INSTRUCTOR-LED PROGRAM

# HashiCorp Terraform on AWS

*Infrastructure as Code — from the core workflow to certification and a real deployment pipeline.*

PREPARES YOU FOR **HashiCorp Certified: Terraform Associate (004)** · Terraform 1.12

**DURATION**

**6 Days**  
**18 Hours**

**FORMAT**

**Instructor-led**  
**Hands-on Labs**

**LEVEL**

**Cloud-aware**  
**→ Associate**

**CLOUD**

**Amazon**  
**Web Services**

Delivered by **Greens Technologies**, Perumbakkam.

## 01 Course Overview

This six-day, instructor-led program provides a structured, hands-on path to provisioning and managing infrastructure on Amazon Web Services with HashiCorp Terraform. Beginning with the principles of Infrastructure as Code and the Terraform core workflow, participants progress through configuration-language fundamentals, state management, reusable modules, and collaborative workflows with HCP Terraform — then apply everything by building a complete infrastructure deployment pipeline.

Delivered by Greens Technologies, the program pairs concise theory with guided laboratory exercises on live AWS environments, so participants leave able to author, deploy, and maintain production-grade Terraform configurations with confidence.

### ◆ ALIGNED TO THE OFFICIAL EXAM BLUEPRINT

This program is mapped to the complete objective set for the **HashiCorp Certified: Terraform Associate (004)** exam (tested on Terraform 1.12), published by HashiCorp at [developer.hashicorp.com/certifications/infrastructure-automation](https://developer.hashicorp.com/certifications/infrastructure-automation). Across our six days we cover all eight objective domains and then consolidate readiness with a timed practice examination.

### What you will learn

- Explain Infrastructure as Code and the benefits of a declarative, service-agnostic workflow.
- Install, configure, and version Terraform and the AWS provider, and run the end-to-end workflow.
- Author configurations using variables, complex types, expressions, functions, and data sources.
- Manage Terraform state safely with remote backends, state locking, and drift detection.
- Design and consume reusable modules, and operate collaborative workflows with HCP Terraform.
- Build a CI/CD infrastructure pipeline with Git, Jenkins, and Terraform, and sit the (004) exam.

#### COURSE AT A GLANCE

##### CERTIFICATION TARGET

HashiCorp Certified: Terraform Associate (004)

##### DELIVERY MODE

Instructor-led with hands-on labs

##### AUDIENCE

Cloud-aware professionals new to Terraform

##### DURATION

6 days · 3 hours/day · 18 hours total

##### CLOUD PLATFORM

Amazon Web Services (AWS)

##### PROVIDER

Greens Technologies, Perumbakkam

## 02 Prerequisites & Requirements

- Working familiarity with core cloud concepts — compute, networking, storage, and identity.
- Basic terminal skills on Linux, macOS, or Windows.
- A code editor such as Visual Studio Code installed locally.
- An understanding of on-premises and cloud architecture.
- An active AWS account with programmatic access; the AWS Free Tier is sufficient.
- No prior Terraform experience is required — the course starts from first principles.

## 03 Daily Curriculum

Each day runs three instructional hours of focused theory and guided AWS labs. The Terraform Associate (004) objective domains advanced each day are noted on every card.

### DAY 1

## Foundations & the Core Workflow

3 HOURS

*Focus — Understand what Terraform is, why Infrastructure as Code matters, and run the workflow end-to-end against AWS.*

- Infrastructure as Code: concepts, benefits, and use cases
- Installing and versioning Terraform and providers
- HCL fundamentals: blocks, arguments, and expressions
- The core workflow: init → plan → apply → destroy
- Multi-cloud, hybrid-cloud, and service-agnostic workflows
- How Terraform uses providers; the plugin model
- Configuring the AWS provider; a first EC2 resource
- Formatting and validating configurations (fmt, validate)

MAPS TO

Domain 1

Domain 2

Domain 3

### DAY 2

## Terraform Configuration

3 HOURS

*Focus — Write flexible, dynamic configurations with variables, complex types, expressions, and dependencies.*

- Differentiating resource and data blocks
- Input variables and output values
- Dynamic configuration with expressions and functions
- Validating configuration with custom conditions
- Resource attributes and cross-resource references
- Complex types: list, map, set, object, tuple
- Dependencies: depends\_on & create\_before\_destroy
- Sensitive data: Vault, ephemeral values & write-only arguments

MAPS TO

Domain 4

## DAY 3

## State Management &amp; Maintaining Infrastructure

3 HOURS

*Focus — Manage Terraform state safely and maintain infrastructure over its lifecycle.*

- How Terraform uses and manages state
- Remote state on AWS: S3 backend with DynamoDB locking
- Detecting and reconciling resource drift
- Inspecting state with the CLI
- The local backend and state locking
- Configuring remote state with the backend block
- Importing existing infrastructure into state
- Verbose logging and troubleshooting (TF\_LOG)

MAPS TO

Domain 6

Domain 7

## DAY 4

## Modules &amp; Reusability

3 HOURS

*Focus — Build and consume modules to create maintainable, DRY infrastructure.*

- Why modules: composition, reuse, and standardization
- Root and child modules; module structure
- Using modules in configuration; inputs and outputs
- Building a reusable AWS module (e.g., VPC or EC2)
- How Terraform sources modules (local, Git, Registry)
- Variable scope within modules
- Managing and constraining module versions
- The dependency lock file and provider constraints

MAPS TO

Domain 5

## DAY 5

## HCP Terraform, Governance &amp; Exam Readiness

3 HOURS

*Focus — Adopt collaborative, governed workflows with HCP Terraform, then consolidate for the exam.*

- Using HCP Terraform to create infrastructure
- Organizing workspaces and projects
- Community vs. Enterprise/HCP edition features
- Exam logistics, registration, and strategy
- Collaboration and governance features (policy, cost)
- Configuring and using HCP Terraform integrations (VCS)
- Full review across all eight objective domains
- Practice questions and a timed mock exam

MAPS TO

Domain 8

Full Review

*Focus — Bring it all together: automate provisioning of an AWS application with a Git → Jenkins → Terraform CI/CD pipeline.*

- Project brief & architecture: CI/CD for infrastructure
- Protecting state and secrets (.gitignore, remote state)
- Authoring a declarative pipeline (Jenkinsfile)
- Injecting AWS credentials securely into the pipeline
- Version control with Git: repo structure and branching
- Installing and configuring Jenkins; credentials management
- Stages: checkout → init → validate → plan → approval → apply
- Automated teardown; end-to-end deployment & review

Capstone

Domains 3 · 6 · 8

## 04 Exam Objective Coverage

Every objective domain of the Terraform Associate (004) exam is addressed within the program. The capstone on Day 6 reinforces the workflow, state, and HCP domains in an automated, real-world context.

| # | OBJECTIVE DOMAIN                            | COVERED ON    |
|---|---------------------------------------------|---------------|
| 1 | Infrastructure as Code (IaC) with Terraform | Day 1         |
| 2 | Terraform fundamentals                      | Days 1–3      |
| 3 | Core Terraform workflow                     | Day 1 · Day 6 |
| 4 | Terraform configuration                     | Day 2         |
| 5 | Terraform modules                           | Day 4         |
| 6 | Terraform state management                  | Day 3 · Day 6 |
| 7 | Maintain infrastructure with Terraform      | Day 3         |
| 8 | HCP Terraform                               | Day 5 · Day 6 |

Objective domains as published by HashiCorp · [developer.hashicorp.com/certifications/infrastructure-automation](https://developer.hashicorp.com/certifications/infrastructure-automation)

## 05 About the Certification

### HashiCorp Certified: Terraform Associate (004)

TESTED ON TERRAFORM 1.12

#### ASSESSMENT TYPE

Multiple choice

#### DELIVERY FORMAT

Online proctored

#### DURATION

1 hour

#### LANGUAGE

English

#### PRICE

US \$70.50 + applicable taxes (retake not included)

#### CREDENTIAL VALIDITY

2 years

### Who should take it

Cloud engineers with foundational Terraform knowledge and skills who can identify HCP Terraform / Enterprise features and distinguish them from the Community edition.

### How this course prepares you

Six days of guided theory and AWS labs cover the full objective set, a Day 5 review with a timed mock exam builds test-readiness, and the Day 6 capstone cements real-world workflow skills.
